The inspiration is the sheep farms buildings of Patagonia. Not the main houses of the estancias, their warm interiors closed to their place, but the buildings made for the sheep farm works where daily life in Patagonia is lived, and finds a splendor of its own; the barns for drying the sheep hides and for the many other works at the estancias, that have to be done inside because of the cold or the wind, or both.

The Courtyard

The empty central courtyard or plaza, introduces the vast wilderness of Patagonia at the core of the hotel. It is surrounded on three sides by two guest rooms buildings, and the main one in the back a little higher, where the common areas of the hotel are located. The plaza is empty, except for a few big boulders, but is full of suggestions: it is like the clear cut that one makes to see the forest. It lets one see what one minds, whether it is the natural environment, or the strong culture that has allowed men and women to enjoy life, as life is in Patagonia.

Latin American Culture

Latin American culture relates its people with nature, without the mediation of streets, towns and cities, as it happens for instance in Europe, since the Middle Ages. Latin America has an ancient tradition of works of architecture that stand in the midst of nature, just to bring signs of life to places where shepherds, or merchants use to pass or to stay by night, or where people gather once in a while, to celebrate, once again, their ancient rites. **Today** our culture may well help modern travelers, coming from big cities, to relate with the natural environment, and have a fruitful experience.

The Form

For me, Architecture is an extra gift. A gift of suggestions that may fill what we usually call the empty space. The place above our heads, that invites one to daydream when one is distracted, looking afar without any intention. Remota appears from the distance as a big black barn, its warm yellow lights gleaming at dawn or night, its interior full of light revealed in part, through the vertical sequence of vertical glass.

The good side of the unexpected

Remota's Architecture reflects that for us, traveling and wandering is all about giving the unexpected a chance to appear, and find good in it as it is. The buildings are enclosed in a continuous sequence of vertical windowpanes opened in the exterior walls.

Building Structure

We used a concrete structure of pillars, slabs and interior walls, to ensure room privacy and fireproofing. The structure is enclosed by waterproof plywood panels with a one-foot-thick expanded polyurethane core as insulation. The panels are coated with a synthetic asphalt membrane to provide the building with the best insulation, and protection against the rain and wind. The asphalt membrane is covered with black fine gravel to protect it from the UV rays.

The PVC double glazing thermo windowpanes, form a continuous sequence of vertical openings in the exterior walls.

The landscape

In the courtyard some big erratic boulders stand to enforce the

sense of emptiness and capture the low light of the sun at dawn or dusk. The wild landscape of the Patagonian plains covers also the roofs of the buildings. The roofs, concrete slabs are coated with the same synthetic asphalt membrane and a carpet of wild grasses two feet high. There are three wooden corridors; that connect the three buildings in a shortcut that crosses the courtyard. Two of them are covered, and another one, which goes to the pool and sauna house is open. The corridor's low wooden walls put a limit to the courtyard, and its roof's straight line forms a closed horizon that lets one appreciate the vastness beyond.

The interior design

The ever changing light of Patagonia penetrates the building through the sequence of vertical cuts of the windowpanes. Then it surrounds big concrete or wooden pillars, and slides along the ceiling's wooden trellises that hang well under the concrete slab. The light is captured by the bright colors of the fabrics that cover the dark wood furniture. The strong and Spartan geometric furniture was made by carpenters at the job site, out of big pieces of dead native wood, recovered from big forests of lenga trees that still thrive close to the sea in the Patagonian low lands. The guest bedrooms have also some wood sleepers (big pieces of lenga wood) running vertically from the floor to the ceiling, to support thick wooden benches and tables, the beds head, and make the division with the bathroom, more friendly but still soundproof.

Unique construction methods used

The pillars and roof were made first to protect the workers from the bad weather. Then the structure was enclosed with plywood panels industrially made, and very easy to hang. Once the panels were fixed to the slabs, they were coated with the asphalt membrane, that comes in rolls, and is glued to the panels. The PVC double glazing windowpanes were hung afterwards. The construction process was a continuous sequence of works, that allowed for many different teams to work simultaneously.

Energy saving features

Remota uses low consuming light bulbs, while improving its color quality with yellow shades, low consuming water bathroom fittings, laundry system. Good insulation of the building, and the proper orientation to the sun as passive energy, saves energy for heating etc. etc.. The glasses have a UV rays protection film, etc.

The biggest challenges

To make what is unique in the culture and nature of the place to appear in plenitude inside the hotel, to give guests an experience of a lifetime.

How did we overcome those challenges?

With love and care for the work, and for the people who make it. With some expertise, a sea of patience. And passion.

The unexpected

One has to be open to see the good side of the unexpected, which usually is better than what we expect.

うテシ-アメリカ文化
ラティン-アメリカ文化においては人間が中心だ。たとえばヨーロッパでは街角や都市が舞台となるが、そうした舞台なしに物語につきあわざない。ここラティン-アメリカ文化では、自然の中に物語をつくる歓びがある。自然の中に物語をつくる歓びが全くからある。これらの歓謡は、大自然から徒歩で移動する手前まで人間に人々を運ぶ気概をもつて伝承していくからだ。時代は前回よりも流れ変わ。そんなときにはやはり古の儀式がとり行われる。今日まで頼れるのがお祭りであるが、こうした私たちの文化を通じて豊かさとあれい、貴重な精神をもたらすのがお祭りである。

pp. 62-63. Eye of man looking from the courtyard, p. 61. Above: Evening view from the north, p. 61. Below: First morning garrison building from man's building, pp. 68-69. Corridors from garrison building to the man's building on left side and to another garrison building on right side, p. 71. Night view of garrison building. All photos except pp. 62-73 in Crashed Bamboo.

A diagram showing a square piece of paper being folded. The top edge is folded down to meet the bottom edge, creating a central vertical crease. The left edge is folded inwards towards the center, and the right edge is also folded inwards towards the center. This results in a narrow rectangular strip at the top and a wider rectangular base. The four corners of the original square are now tucked under the central fold.
